Capstone Groups

FedEx FDE Training Program, Netherlands cohort
Capstone week: Monday 19 to Friday 23 October 2026, AMSA Schiphol, Prestwickweg 1
Presentations and graduation: Friday 23 October

Group 1
Fabian William Bakker
Rafael Del Hoyo
Siva Prasada Reddy Sogalapalli
Yasin Durgun

Group 2
Szymon Duraj
Deepu James
Maciej Kucia
Neil Weber
Ross Luker

Group 3
Paul Horsley
Luis Ruiz
Mateusz Smet
Vijay Kumar Jupalli

Group 4
Pratik Patel
Daniel Vink
Luis Eduardo Garcia
Sandro Fornasier

Group 5
Milan Zbirkovsky
Brendan Earley
Kamalakannan Kumar
Quynh Chi Vo
Vikram Mahawal

Group 6
Ufuk Celikeloglu
Marc Lemmens
Said Hirsi
Uatilla Almeida

Each group has four or five members. Agree the four roles described on page two before Monday.

Before the Capstone Starts

Arrive on Monday 19 October ready to pass the Phase 1 approval gate. Phase 1 is 1.5 hours. No agent code is written until the instructor signs off the plan.

1. Agree on a problem

- A repetitive, rule-bound task that ends in a decision or a structured result. If one model call would solve it, it is too weak.
- Genuinely agentic: calls at least one tool, reads or writes session state, or delegates to a sub-agent.
- Decide greenfield or brownfield. Brownfield wraps an existing system as a black box that stays untouched.
- Bring one or two backup ideas in case the first is redirected.

2. Draft the description and plan (one to two pages)

- Problem: what task, who feels the pain today.
- Solution: inputs, output shape, decisions the agent makes.
- Scope: what is in and what is explicitly out. Brownfield names the existing system.
- Risks: where the agent can be wrong and the guard for each.
- Build sketch: the ADK constructs you expect to use and why. Single agent first. Do not promise a multi-agent system.
- OpenSpec is fine if you want the plan in a familiar format.

3. Prepare answers to the six architecture questions

- Security, reliability, performance efficiency, cost effectiveness, operational excellence, deployment.
- Deployment target is Google Cloud. Treat it as a design question. You will not deploy live.

4. Read the two sample projects

- Field Report Triage (greenfield) and Pricing Quote Wrapper (brownfield) in the lab guide.
- They include the rapid-peer-review skill and the Go/No-Go checklist template you will reuse.

5. Assign roles (one person each, everyone still codes)

- **Lead.** Owns the plan document, presents it at the approval gate, keeps scope in check during the build, and makes the final Go/No-Go call at the showcase.
- **Repository owner.** Owns the git repo and branching, keeps .env out of it, runs the clean-checkout test (uv sync, adk web) before every milestone, and produces the final zip.
- **Evaluation owner.** Owns the eval set or test suite: main path plus at least one failure path, the brownfield regression check if applicable, and runs the code review into docs/rapid-peer-review.md.
- **Deck owner.** Owns the five-minute presentation: the problem, the ADK design decisions, the evidence from evaluation, and the Go/No-Go slide. Times the rehearsal.
- Groups of five: the fifth member is a second developer and backs up the evaluation owner.

6. Know the deliverables

- Pydantic output_schema with validated output.
- An eval set or test suite covering the main path and at least one failure path.
- Code review written to docs/rapid-peer-review.md with all Fails resolved (RAPID ITC.009).
- A Go, No-Go or Conditional Go decision backed by at least two sentences of cited evidence (RAPID ITC.004).
- Five-minute presentation, deck, and a runnable repo zip, delivered by 9:00 AM on Friday 23 October.

7. Logistics for the onsite week

- A laptop that can run the lab. FedEx guest WiFi onboarding on the first morning.
- AMSA Schiphol, Prestwickweg 1, 1118 LC Schiphol. Class 09:00 to 13:00, office hours 14:00 to 16:00 Monday to Thursday.
